source anonymous pool of 3 colons, age 26 yo male, 49 yo
female, 71 yo male colon; 46 yo male kidney, and pool of stomachs, 62 yo male and 70 yo female. Library is
oligo-dT primed and directionally cloned (EcoRV site is
destroyed upon cloning). Average insert size 1.4 kb,
insert size range 1-3 kb. Library is normalized and
enriched for full-length clones and was constructed by C.
Gruber (Invitrogen). Research Genetics tracking code
023. Note: this is a NIH MGC Library."

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CACCTGACGGTGATCTTGGGCAGAACATACCGGGGTGGTCCCTGGCGAGGAGGAGCAGAAA 600
                                                                                                                                                                                                                                                                                                                                 The present invention relates to a method of producing extracellularly secreted, active, correctly folded, recombinant tissue plasminogen activator (tPA). Kringle 2 serine protease molecule (KSS) or their variants in prokaryotic cells by expressing the protein-encoding DNA operably linked to DNA coding for signal peptide OmpA. The method is useful for producing recombinant DNA-derived tPA, K2S or their variants. Sequences of the invention are useful for manufacturing a medicament for treating stroke, cardiac infarction, acute myocardial infarction, pulmonary embolism, any artery occlusion such as intracranial artery occlusion (e.g., arteries supplying the brain), peripherally occluded arteries, coronary artery occlusion, deep vein thrombosis or related diseases associated with unwanted blood clotting. The present sequence is a DNA encoding a fusion protein comprising OmpA and K2S protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        9

                                                                                                                                                                                                                                      This sequence encodes a non-glycosylated tPA deriv. lacking the finger- and EGF-domains. The polypeptide has a lower clearance rate (longer half-life) than natural tpA while retaining thrombolytic activity and stimulation by fibrin. (Updated on 09-JAN-2003 to add missing OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New non-glycosylated form of tissue plasminogen activator - with thrombolytic activity and long plasma life
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

                                                                                                                                                                                                                                   One N-glycosylation site, i.e. NSS (117-119) is substituted with NSM and the N-glycosylation is removed.
Plasmid encoding the modified tPA is 99-6300 and its transformant is E.coli RR1.Zem 99-6300 (FERM P-9127).
This modified tPA, used to treat thrombosis, is of high quality and has a longer half life period in blood.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1169
                                                                                                                                                                                             It is modified in the patent by replacing one or more codons specifying a positively charged amino acid. The resulting analogues are inserted into a replicable expression vector which is used to transform or transfect a host cell which is grown to express a t-pA analogue. The t-pA analogue is useful for the treatment of diseases or disorders associated with the formation of thrombi in blood vessels e.g. infarctions, thrombosis and embolism. The analogue, in the 1-chain form, exhibits the properties of a proenzyme; however on plasmin-catalysed cleavage of the one-chain form, the activity of the 2-chain form is fully retained. Compared to native t-pA, it has a higher fibrin selectivity, this results in a fibrinolytic agent with a higher fibrin selectivity, as the fibringenolytic activity induced by the analogue is reduced (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AGAAATTTGAAGTCGAAAAATACATTGTCCATAAGGAATTCGATGATGACACTTACGACA 1229
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              535
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            809
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          869

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 tPA with N-terminal peptide of plasminogen linked is more stable in vivo than the native form. It is useful as a thrombolygic agent in the treatment of vascular diseases eg myocardial infarction, pulmonary embolism etc.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A cDNA clone of human tissue plasminogen activator (tPA) was amplified by PCR using the primers given in AAQ87368-69. The amplified tPA DNA (AAQ8730) was ligated into vector KS+ to obtain plasmid TPA-KS+. The construct was used in combinatorial methods involving RNA splicing-mediated shuffling of tPA domains, in plasmid piNU1 (AAQ87347) to generate novel tPAs having improved thrombolytic properties.

The present sequence represents the human tissue plasminogen activator gene. It was used to construct plamsid TPA-KS+, which is used in the course of the invention. The specification describes a purified course of the invention. The specification describes a purified sequence of a group II intron, including an exon binding site not naturally present in the intron and a second segment comprising a site acceptor, and a nucleophilic group for transesterifying a phosphodiester bond of an RNA. Together the two segments form an a phosphodiester bond of an RNA. Together the two segments form an phosphodiester bond of an RNA. Together the two segments form an a phosphodiester bond of an RNA. Together the two segments form an the first segment into substrate RNA by a reverse splicing reaction. The reverse-splicing introns are used, by specific cleavage and ligation of discontinuous nucleic acid, to generate new genes and gene products, of discontinuous nucleic acid, to generate new genes and gene products, manipulation, e.g. replacements for restriction enzymes) or immunologically active or signal-transducing proteins such as antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Reverse splicing construct containing fragments of autocatalytic introns - able to cleave and ligate discontinuous nucleic acid for generating new genes and e.g. ribozymes, libraries of enzymes and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The patentors claim a novel recombinant human t-PA which is resistant to specific enzymatic cleavage because it is stabilised by site-directed mutagenesis at a 2-chain cleavage site. Partic: the natural Arg at position 275 is replaced by Gly or Glu, or Ile at position 276 is replaced by Gly or Glu, or Ile at position 276 is replaced not 276 refer to the posn. of the AAS in the mature protein; i.e. AAS 310 and 311 of AAP60790). Also new are (1) DNA sequences; (2) expression vectors; and (3) microorganisms and cell cultures transformed with these vectors.
